

Infrared Heat For Food

Meat

Appetisingly Brown

Hams are browned and hamburgers are roasted so that they taste better to us. Chicken and other poultry meat is browned on the outside before being used in sandwiches.

Infrared heat finds particular application in modern meat preparation. Medium wave carbon infrared emitters heat meat surfaces in a targeted fashion. Sandwich meat, hamburgers and hams are made to look even more appetising without additional fat.

Hamburger meat is browned

Infrared is used to brown chicken meat for sandwiches

Infrared heat makes cooked ham look appetising

Desserts | Cakes | Biscuits

Looking Sweet

People love desserts, biscuits and cakes but they must still look good enough to eat. Infrared heat ensures that almonds are warmed before being flaked, that the sugar on crème brûlée or pavlova is browned and that cheese cake has an attractive colour.

Infrared emitters from Heraeus are modern heat sources. Without any pre-heating and with very efficient energy input, heat is applied precisely where it is required.

Cheese cake receives a browned surface

Baking biscuits

Heating almonds before crushing

Melting of sugar on crème brûlée

Chocolate

Fine Quality

Filling chocolate with caramel

Filled chocolates need infrared heat – and a lot of it. Chocolate halves are heated before they are filled and then once more to seal them. The edges of two chocolate half shells are slightly melted so that they can be firmly joined together. Also the plastic moulds can be preheated prior to filling or warmed to allow cleaning before the chocolate-making process begins again.

Each of these heating stages must be carried out at a precise temperature for a precise time.

Infrared emitters from Heraeus have very fast response times and so can be very closely controlled. And that is very important for the quality of fine chocolates.

Heating moulds before filling

Fusing chocolate halves together

Bread

It's not only the crust that counts

Disinfection of baking trays

Yeast allows dough to rise and become aerated – if the baker has done everything right. However, if yeast grows well, mildew also thrives, and nobody wants to find this in bread. Consequently, during the baking of bread, rolls and other baked products, the dough must be able to ferment without the propagation of unwanted mildew or other microbes.

Baking trays, and all other baking equipment, must at all times be hygienically faultless. Disinfection and the elimination of fungal growth on surfaces and equipment is therefore a priority.

Newly baked bread also has a longer shelf-life without the addition of conservation materials when it is briefly disinfected once again before packing.

Infrared radiation transfers large amounts of energy in a short time. Disinfection with infrared is a thermal disinfection, using controlled heat.

Carbon infrared kills spores reliably and practically. And there is no problem with thicker spore layers, porous surfaces or dust particles.

Disinfecting bread before it passes through the bread cutter

Ready Meals

You eat with your eyes

Compact infrared system dovetail into every factory

Infrared heat makes ready meals more attractive. Carbon infrared emitters brown the toppings or other garnishing of ready meals, without causing any further unwanted cooking of the meal itself. Compared with conventional heating sources, carbon emitters are more efficient, saving energy and minimising maintenance costs.

Heraeus infrared systems are so compact that the complete manufacturing plant design can be improved and valuable production space reclaimed.

Technology

Clean and Reliable

For the food sector, infrared modules are manufactured in stainless steel and fitted with a wire mesh to afford mechanical protection. An additional foil frame can, if requested, protect the food from any falling particles.

Infrared emitters from Heraeus are very responsive and can be switched on and off inside 1-2 seconds.

All infrared systems can be controlled so that any unexpected or unwanted conveyor belt stoppage will have minimal effect on the equipment or product.

Emitter failure detection is also incorporated within the control system.

The parameters required for any system can be established in one of our test centres or by using hire modules on site. The investigations are carried out by experienced engineers and technicians, who can assist in the selection of the right emitters and systems to suit a particular product and process.

Other Applications

Infrared heat provides a particularly efficient and reliable solution for many heating processes in the food sector.

Apart from the applications described here, there are many more:

- Baking of bread and cakes
- Roasting without fat
- Cooking sausages
- Heating wafers prior to embossing
- Setting coatings on chicken strips
- Browning waffles
- "Relaxing" shellfish
- Melba toast
- Blackening vegetables
- Browning of hams
- Popping corn for cereals
- Branding of meat and cheese

The incredible power of light ® Photonics-based solutions from ultraviolet to infrared

Heraeus Noblelight covers the total spectrum of technically usable wavelengths and can help find the optimum light system solution to suit specific processes. Whether you wish to optimize existing applications or win new markets, we offer efficient, well thought-out and long-life solutions that give you a lasting competitive advantage.

Heraeus Noblelight is part of the Heraeus technology group, a globally active family-owned enterprise. Within the Heraeus group, we have direct access to fundamental technologies and high-quality materials such as quartz glass, important precious metals and specialty materials. Rely on the acknowledged Heraeus quality!

Infrared emitters and systems for industrial heating processes.

With a wealth of experience encompassing more than 3000 different heating processes, we can match our emitters precisely to meet your needs in terms of spectrum, power, length and shape.

Make use of the intelligence of infrared technology.

In contrast to conventional thermal processes, infrared transmits large amounts of energy in a short time. This heat is used exactly where it is required and only for as long as it is required for a particular process. This offers energy savings of up to 50 %.

Profit from Heraeus quality

– the proven twin tube design – contoured emitters, which are shaped to match the geometry of your work piece – the new QRC® emitter, with its nano reflector for stable heating processes under aggressive ambient conditions. Convince yourself personally in our Application Centers.

Make use of our expertise and experience to optimize your production process and realize real competitive advantage.
